

Conventional farming

- What are the problems of conventional farming today ?

Conventional farming

- What are the problems of conventional farming today ?

The first problem of conventional farming today is that the chemical products we use to artificialize crops are harmful to the environment.

The second is that the products used pollute the groundwater.

The third and the most important is that conventional farming kills soils and subsoils.

Conventional farming

- What are the problems of conventional farming today ?

The first problem of conventional farming today is that the chemicals products we use to artificialize crops are more or less harmful.

The second is that the products used pollute the groundwater.

The third and the most important is that conventional farming kills soils and subsoils.

- What are the solutions ?

The first problem of conventional farming today is that the chemicals products we use to artificialize crops are more or less harmful.

The second is that the products used pollute the groundwater.

The third and the most important is that conventional farming kills soils and subsoils.

- What are the solutions ?

introduce insects that can eliminate others insects which will prevent the use of pesticides.

Conventional agriculture is the most practiced in the world, it appeared after the great world wars that greatly improved the knowledge of chemistry. It's an agriculture where the treatments are done with more or less harmful chemicals

Conventional agriculture is the most practiced in the world, it appeared after the great world wars that greatly improved the knowledge of chemistry. It's an agriculture where the treatments are done with more or less harmful chemicals

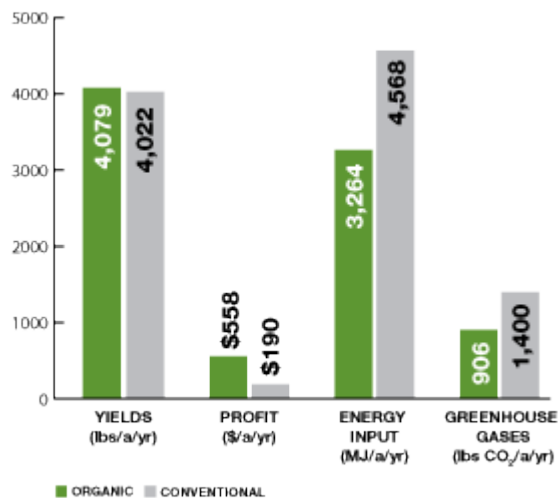

Thanks to mechanization, the volume of work has decreased. The use of chemicals (pesticides) in agriculture makes it possible to artificialise crops.

For the case of Europe there is the CAP which appeared in 1962 whose aims were to ensure food self-sufficiency in Europe and also an improvement in the incomes of farmers
Financial aid (grants) have been granted but with the obligation to use:

- chemical fertilizers
- pesticides

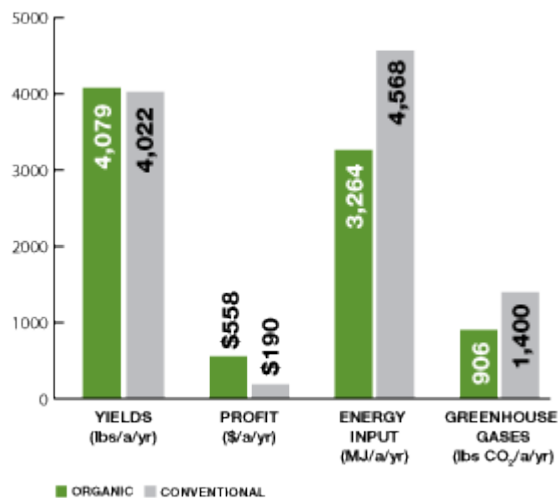

This resulted in increased productivity and their income.

Financial aid (grants) have been granted but with the obligation to use:

- chemical fertilizers
- pesticides

This resulted in increased productivity and their income.

On this graph we observe that the incomes are equivalent, the production rate compared to incomes is higher than for organic farms
